COACH (Kindo)
Teach me about the IT services project
Hello marcus! I'm COACH, and I'm here to help you master the "IT Services" project.
I see you're new to our coaching sessions. While I can certainly dive right in, I usually recommend a baseline assessment through MENTOR to better tailor my teaching to your style. However, we can skip that for now and get started immediately!
Based on our organization's policy, I have access to several IT-related projects (like ITS and ITO). To make sure I'm teaching you the right material, could you clarify if you are referring to a specific Jira project (like IT Service Management), or a general concept of how IT services are managed here?
Once you let me know, we'll start the Feynman Cycle:
1. Explain Simply: I'll break down a core concept.
2. Check Understanding: I'll ask you a quick application question.
3. Mastery: You'll explain it back to me in your own words.
What specific part of the IT services project are you most curious about?
What is the ITS project about?
How do I access the IT services project?
What are the main project workflows?
Describe what you want to know or do next

COACH (Kindo)

Teach me about the IT services project

Hello marcus! I'm COACH, and I'm here to help you master the "IT Services" project.

I see you're new to our coaching sessions. While I can certainly dive right in, I usually recommend a baseline assessment through MENTOR to better tailor my teaching to your style. However, we can skip that for now and get started immediately!

Based on our organization's policy, I have access to several IT-related projects (like `ITS` and `ITO`). To make sure I'm teaching you the right material, could you clarify if you are referring to a specific Jira project (like **IT Service Management**), or a general concept of how IT services are managed here?

Once you let me know, we'll start the **Feynman Cycle**:

1. **Explain Simply**: I'll break down a core concept.
2. **Check Understanding**: I'll ask you a quick application question.
3. **Mastery**: You'll explain it back to me in your own words.

What specific part of the IT services project are you most curious about?

What is the ITS project about?
How do I access the IT services project?
What are the main project workflows?

i hjave a prof

COACH (Kindo)

In a traditional project, you might just track tasks. In an IT Services project (like our `ITS` project), the goal is to manage the **lifecycle of a request**. When a user has a problem (an **Incident**) or needs something new (a **Service Request**), the project provides a single, organized point of contact to ensure that "guest" gets what they need without seeing the chaos in the kitchen.

Key components:

- **The Portal:** Where users ask for help (the "front desk").
- **Queues:** Where IT agents see and sort requests based on urgency.
- **SLAs (Service Level Agreements):** The "timer" that ensures we respond within a promised window.

Check for Understanding

Since you're a fan of **efficiency**, imagine this scenario:

The entire office Wi-Fi goes down. At the same time, one executive forgets their password. In an IT Services project, both are "tickets," but they shouldn't be treated the same.

How would the IT Services project use "Categorization" or "Priority" to ensure the team stays efficient in this moment?

What's an ITSM ticket lifecycle?
How do incidents differ from requests?
How are SLAs set here?

Describe what you want to know or do next

COACH (Kindo)

Spot on. You've identified the difference between **Impact** (how many people are affected) and **Urgency** (how quickly it needs to be fixed). In ITSM, we call this the **Priority Matrix**.

By prioritizing the Wi-Fi, you're maximizing **Total Productive Hours**—which aligns perfectly with your strength in efficiency.

Concept 2: Incidents vs. Problems (The "Leaky Pipe" Analogy)

To keep an IT project efficient, we have to distinguish between fixing a symptom and fixing the cause.

- **Incident:** This is a one-time disruption. *Example: Your laptop won't connect to the printer.* You fix it so the user can get back to work immediately.
- **Problem:** This is the **underlying cause** of one or more incidents. *Example: You realize the printer's wireless card is faulty and keeps dropping connections for everyone.*

If you only treat everything as an *Incident*, you are just "mopping the floor" every time the pipe leaks. If you identify it as a *Problem*, you "fix the pipe" so the floor stays dry.

Mastery Gate (Explain it back)

To make sure we've closed the gap on this distinction:

In your own words, if you were managing the IT Services project, why would it be a waste of time (inefficient) to only focus on "Incidents" and ignore "Problems"?

What is an ITSM workflow?

To keep an IT project efficient, we have to distinguish between fixing a symptom and fixing the cause.

- **Incident:** This is a one-time disruption. *Example: Your laptop won't connect to the printer.* You fix it so the user can get back to work immediately.
- **Problem:** This is the **underlying cause** of one or more incidents. *Example: You realize the printer's wireless card is faulty and keeps dropping connections for everyone.*

If you only treat everything as an *Incident*, you are just "mopping the floor" every time the pipe leaks. If you identify it as a *Problem*, you "fix the pipe" so the floor stays dry.

Mastery Gate (Explain it back)

To make sure we've closed the gap on this distinction:

In your own words, if you were managing the IT Services project, why would it be a waste of time (inefficient) to only focus on "Incidents" and ignore "Problems"?

What is an ITSM workflow?

incidents are just a snapshot in time, problems that last for too long lea

COACH (Kindo)

Spot on. You've identified the difference between **Impact** (how many people are affected) and **Urgency** (how quickly it needs to be fixed). In ITSM, we call this the **Priority Matrix**.

By prioritizing the Wi-Fi, you're maximizing **Total Productive Hours**—which aligns perfectly with your strength in efficiency.

Concept 2: Incidents vs. Problems (The "Leaky Pipe" Analogy)

To keep an IT project efficient, we have to distinguish between fixing a symptom and fixing the cause.

Concept 3: The Service Catalog (The "Menu")

To maintain the **efficiency** you value, an IT Services project uses a **Service Catalog**.

Without a catalog, users just send vague emails like *"My computer is slow"* or *"I need access."* This forces IT agents to waste time asking follow-up questions.

The **Service Catalog** is like a **restaurant menu**. Instead of asking the chef to "make something good," the user picks a specific item (e.g., "Request New Software" or "Report Hardware Issue"). Each "dish" on the menu comes with a specific form that collects exactly what the IT team needs to start working immediately.

Why this matters for the project:

- **Standardization:** Every request for a new laptop looks the same.
- **Automation:** Some requests (like a password reset) can be handled by a bot without a human ever touching it.

Check for Understanding

Imagine you are designing a "Menu" item for **"Requesting a New Monitor."**

To make sure the IT team doesn't have to email the user back and forth (which is inefficient), **what are two specific pieces of information you would force the user to provide on that request form?**

What is an SLA?
How does the service catalog work?
What's the next ITSM concept?

Describe what you want to know or do next

COACH (Kindo)

In an IT Services project, we don't just change things on the fly. If an engineer decides to update the server software at 2:00 PM on a Tuesday without telling anyone, they might accidentally crash the whole system.

Change Management is the process of ensuring that changes are recorded, evaluated, and authorized before they happen.

Think of it like **Air Traffic Control**. You don't want two planes (or two updates) trying to use the same runway at the same time. You need a plan to:

1. **Assess Risk:** Will this break something else?
2. **Schedule:** When is the best time to do this (e.g., Sunday at 3:00 AM)?
3. **Back-out Plan:** If it fails, how do we quickly undo it?

Mastery Gate (Explain it back)

We've covered the **Service Desk** (Concierge), **Incidents vs. Problems** (Leaky Pipes), the **Service Catalog** (The Menu), and now **Change Management** (Air Traffic Control).

Using your own logic: How does having a "Back-out Plan" for a major system change actually make the IT project *more* efficient in the long run?

What is a change advisory board?
How do incidents get prioritized?
What comes after change management?

Describe what you want to know or do next
